[S0031-9007(98)06656-3]

The cross section in Eqs. (1) and (3) is summed over the spin of the outgoing neutron. This ignores a small neutrino energy shift for spin flip scattering. This energy shift can change the neutrino Boltzmann factor by an amount proportional to the neutron polarization P_n . This will significantly reduce the asymmetry that we have calculated [1] and will be discussed further in a later paper [2].

Also, θ_{in} and θ_{out} are switched in Eqs. (1) and (3).
